

Pulse & Tongue Practice Journal

50 Entries · Clinical Observation Log
Entries 1–25 due at Midterm (Week 5) · Entries 26–50 due at Final (Week 10)
Grade Weight: 10% of final grade

Journal Requirements

Due Dates

- Entries 1–25 → Midterm (Week 5)
- Entries 26–50 → Final (Week 10)
- 10% of your total course grade

Each Entry Requires

- Date & subject (self / lab partner / patient)
- Tongue observation (body + coat + shape)
- Pulse at all 6 positions (Cun/Guan/Chi × L/R)
- Pulse qualities identified
- Pattern impression & clinical notes

OVERALL PATTERN	EIGHT PRINCIPLES	PRIMARY ORGAN(S)	INSTRUCTOR / LAB FEEDBACK
1. Overall Pattern: The diagram illustrates the process of protein synthesis, showing the flow from DNA to mRNA to a ribosome where a polypeptide chain is synthesized. 2. Key Components: The diagram includes DNA (double helix), mRNA (single strand), a ribosome (large and small subunits), and a growing polypeptide chain. 3. Processes: The processes shown are transcription (DNA to mRNA) and translation (mRNA to protein).	1. Principle 1: Central Dogma: The flow of genetic information is from DNA to RNA to protein. 2. Principle 2: Complementary Base Pairing: DNA and RNA base pair according to the rules: A with T/U, C with G. 3. Principle 3: Codon-Anticodon Interaction: The mRNA codon (3 bases) pairs with the tRNA anticodon (3 bases) to ensure the correct amino acid is added.	1. Primary Organ(s): The process occurs in the nucleus (transcription) and the cytoplasm (translation). 2. Key Organelles: The ribosome is the site of translation.	1. Instructor Feedback: The diagram is clear and well-labeled, showing the flow of information and the key components of protein synthesis. 2. Lab Feedback: The diagram is a good representation of the process, but it could be improved by showing the role of tRNA more explicitly.

OVERALL PATTERN	EIGHT PRINCIPLES	PRIMARY ORGAN(S)	INSTRUCTOR / LAB FEEDBACK
1. Overall Pattern: The diagram illustrates the process of protein synthesis, showing the flow from DNA to mRNA to a ribosome where a polypeptide chain is synthesized. 2. Key Components: The diagram includes DNA (double helix), mRNA (single strand), a ribosome (large and small subunits), and a growing polypeptide chain. 3. Processes: The processes shown are transcription (DNA to mRNA) and translation (mRNA to protein).	1. Principle 1: Central Dogma: The flow of genetic information is from DNA to RNA to protein. 2. Principle 2: Complementary Base Pairing: DNA and RNA bases pair according to their chemical structure (A with T/U, G with C). 3. Principle 3: Codon-anticodon pairing: The mRNA codon sequence determines the amino acid sequence of the protein. 4. Principle 4: Ribosome structure: The ribosome is composed of two subunits, large and small, which facilitate the assembly of the polypeptide chain. 5. Principle 5: Initiation: The process begins with the binding of the mRNA to the ribosome. 6. Principle 6: Elongation: The polypeptide chain grows as amino acids are added to the growing end of the chain. 7. Principle 7: Termination: The process ends when a stop codon is reached, releasing the completed polypeptide chain. 8. Principle 8: Post-translational modification: The newly synthesized polypeptide chain may undergo further modifications to become a functional protein.	1. Primary Organ(s): The primary organ(s) involved in protein synthesis is the ribosome, which is found in the cytoplasm of all cells.	1. Instructor / Lab Feedback: The diagram effectively communicates the complex process of protein synthesis, highlighting the key components and steps involved.

OVERALL PATTERN	EIGHT PRINCIPLES	PRIMARY ORGAN(S)	INSTRUCTOR / LAB FEEDBACK
1. Overall Pattern: The diagram illustrates the process of protein synthesis, showing the flow from DNA to mRNA to a ribosome where a polypeptide chain is synthesized. 2. Key Components: The diagram includes DNA (double helix), mRNA (single strand), a ribosome (large and small subunits), and a growing polypeptide chain. 3. Processes: The processes shown are transcription (DNA to mRNA) and translation (mRNA to protein).	1. Principle 1: Central Dogma: The flow of genetic information is from DNA to RNA to protein. 2. Principle 2: Complementary Base Pairing: DNA and RNA bases pair according to their chemical structure (A with T/U, C with G). 3. Principle 3: Codon-anticodon pairing: The mRNA codon sequence determines the amino acid sequence of the protein. 4. Principle 4: Ribosome structure: The ribosome is composed of two subunits that facilitate the assembly of the polypeptide chain. 5. Principle 5: Initiation: The process begins with the binding of the mRNA to the ribosome. 6. Principle 6: Elongation: The polypeptide chain grows as amino acids are added to the growing end. 7. Principle 7: Termination: The process ends when a stop codon is reached. 8. Principle 8: Post-translational modification: The newly synthesized protein may undergo further modifications.	1. Primary Organ(s): The process of protein synthesis occurs in the cytoplasm of all cells. 2. Specific Organelles: The ribosome is the site of translation, and the nucleus is the site of transcription.	1. Feedback: The diagram is clear and concise, effectively illustrating the complex process of protein synthesis. 2. Improvements: The diagram could be improved by including more detail about the specific steps of transcription and translation, and the role of various enzymes and factors.

OVERALL PATTERN	EIGHT PRINCIPLES	PRIMARY ORGAN(S)	INSTRUCTOR / LAB FEEDBACK
1. Overall Pattern: The diagram illustrates the process of protein synthesis, showing the flow from DNA to mRNA to a ribosome where a polypeptide chain is synthesized. 2. Key Components: The diagram includes DNA (double helix), mRNA (single strand), a ribosome (large and small subunits), and a growing polypeptide chain. 3. Processes: The processes shown are transcription (DNA to mRNA) and translation (mRNA to protein).	1. Principle 1: Central Dogma: The flow of genetic information is from DNA to RNA to protein. 2. Principle 2: Complementary Base Pairing: DNA and RNA base pair according to the rules: A pairs with T (or U in RNA), C pairs with G, G pairs with C, and T (or U) pairs with A. 3. Principle 3: Codon Recognition: The mRNA sequence is read in groups of three nucleotides called codons. 4. Principle 4: Anticodon Pairing: Transfer RNA (tRNA) molecules have anticodons that base pair with the mRNA codons. 5. Principle 5: Initiation: The process begins with the small ribosomal subunit binding to the mRNA. 6. Principle 6: Elongation: The ribosome moves along the mRNA, and the polypeptide chain grows as amino acids are added. 7. Principle 7: Termination: The process ends when a stop codon is reached, releasing the completed polypeptide chain. 8. Principle 8: Post-Translational Modification: The newly synthesized polypeptide may undergo further modifications to become a functional protein.	1. Primary Organ(s): The process of protein synthesis occurs in the cytoplasm of all cells. 2. Specific Organelles: The ribosome is the site of translation. The nucleus is where transcription of DNA to mRNA occurs.	1. Instructor Feedback: The diagram is clear and well-labeled, showing the flow of information and the key components of protein synthesis. 2. Lab Feedback: The diagram effectively illustrates the concepts of transcription and translation, and the role of the ribosome and tRNA.
